

Classification Example: Handwriting Recognition

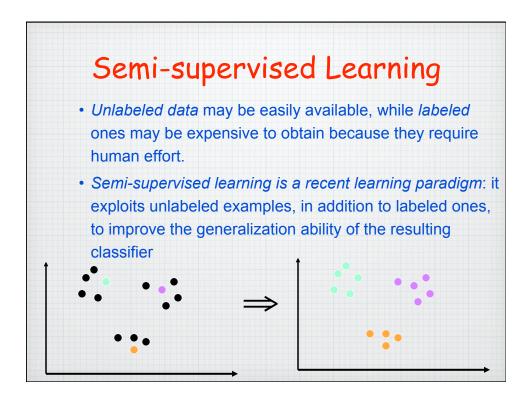

- You've been given a set of N pictures of digits. For each picture, you're told the digit number
 - Discover a set of rules which, when applied to pictures you've never seen, correctly identifies the digits in those pictures

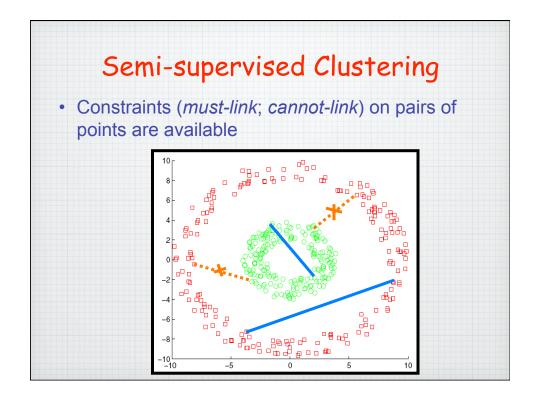

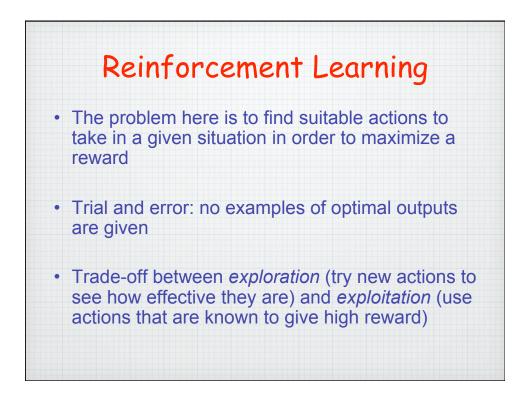

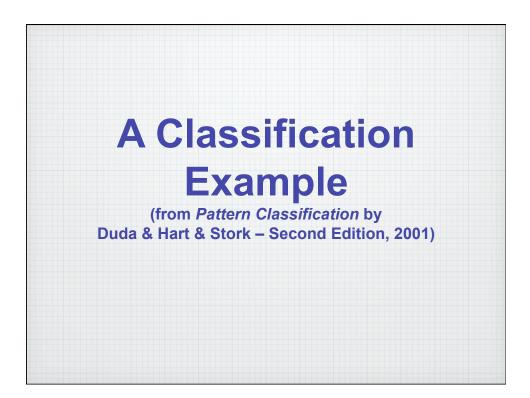

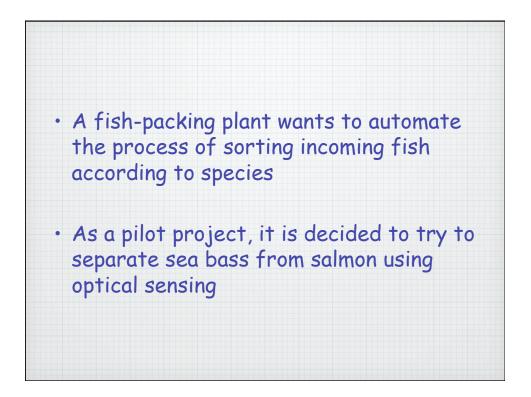

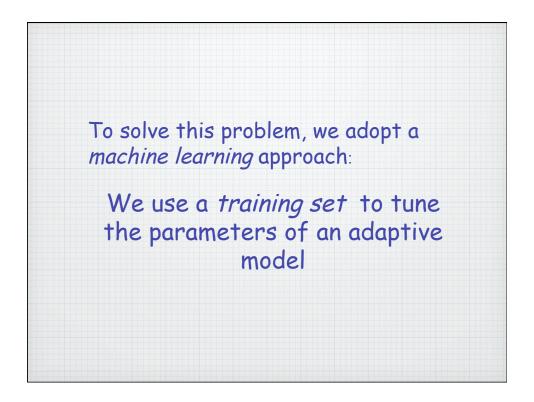

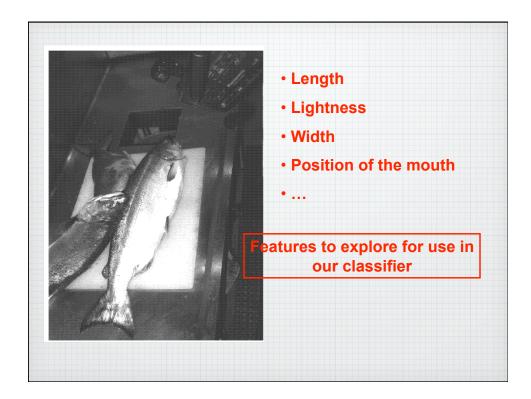

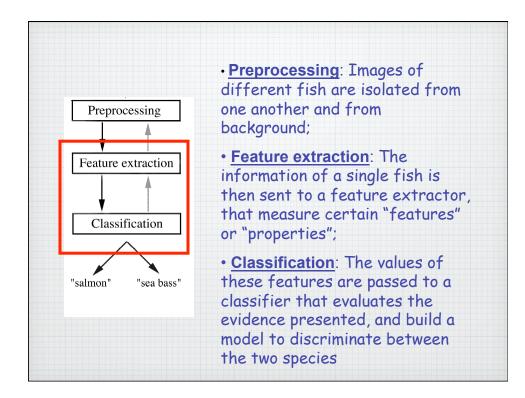

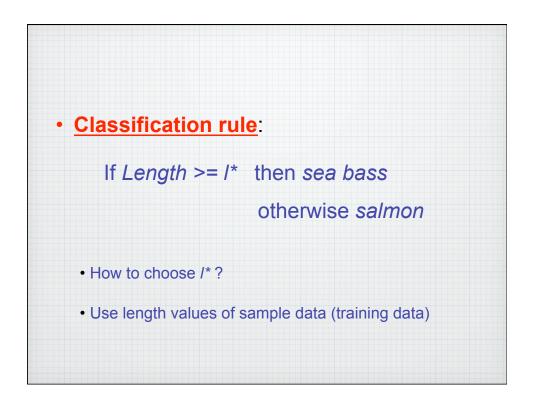

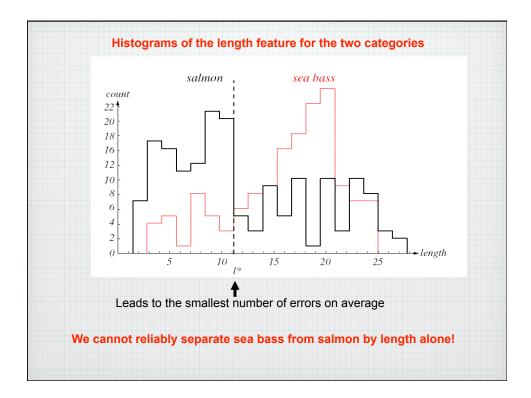

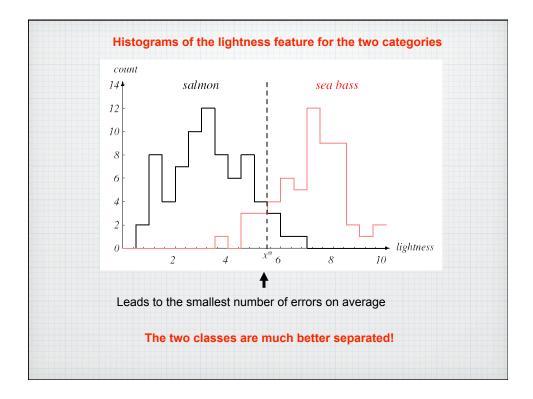

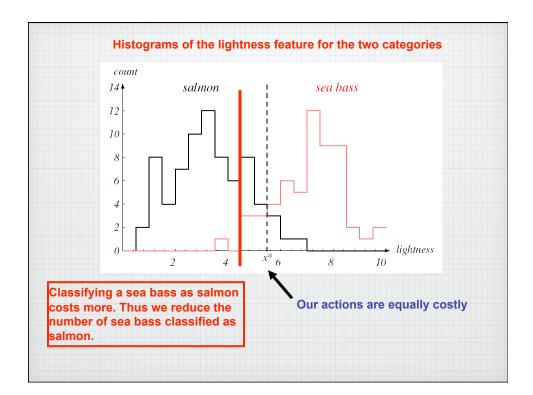

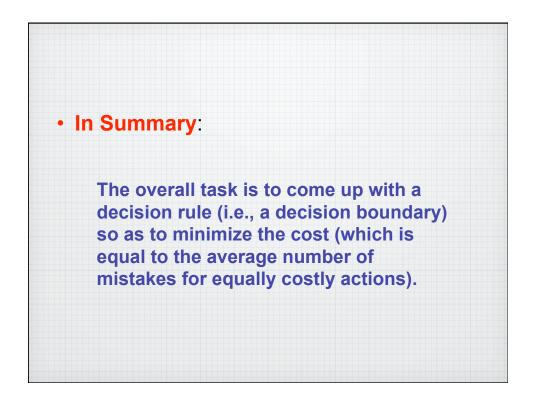

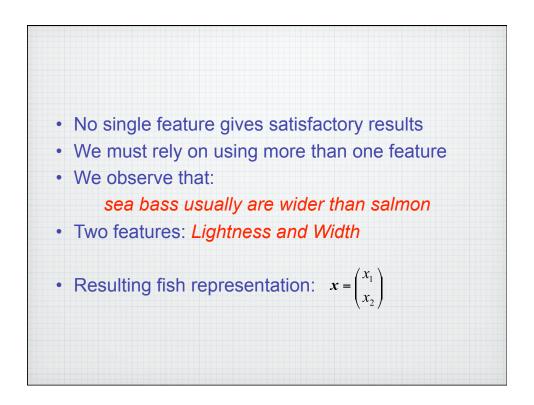

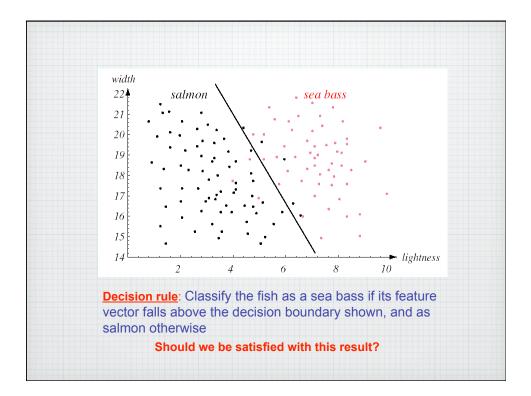

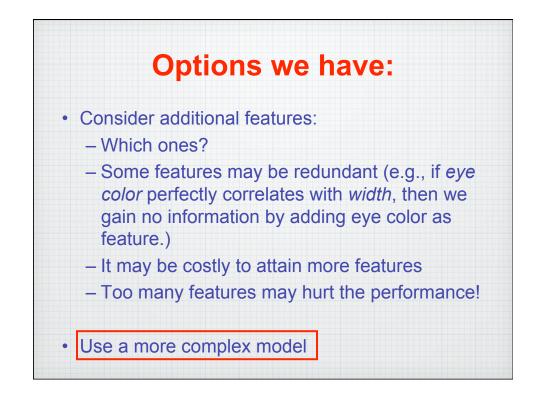

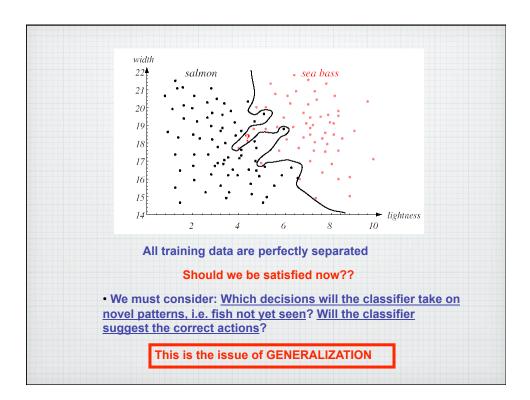

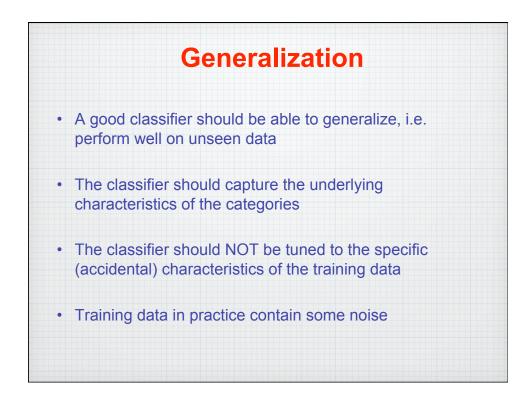

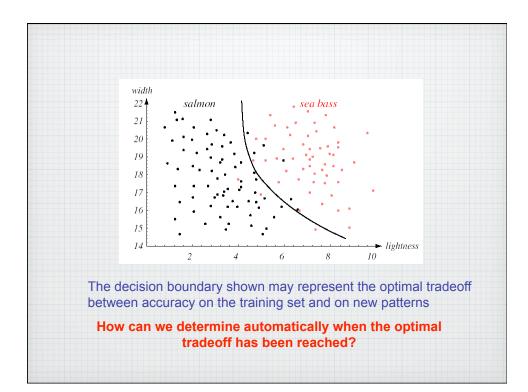

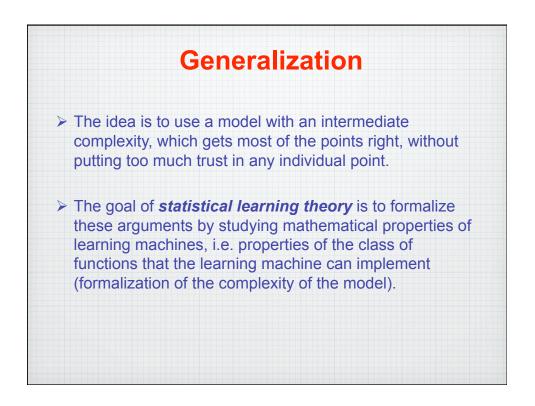

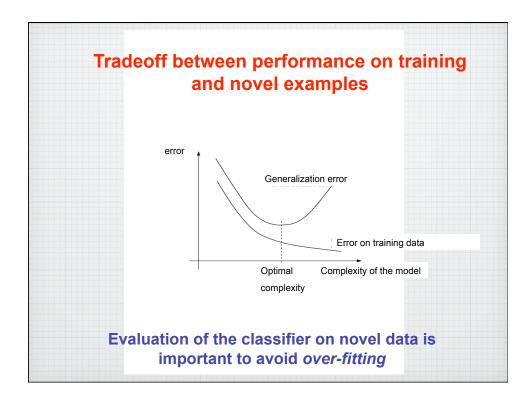

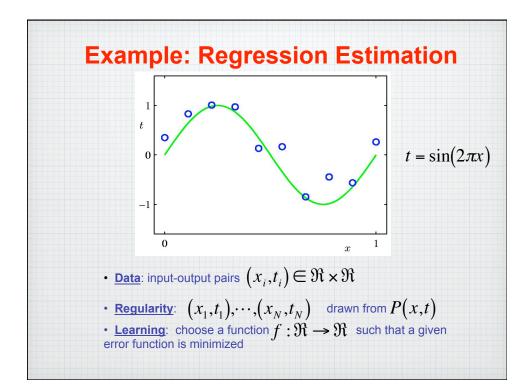

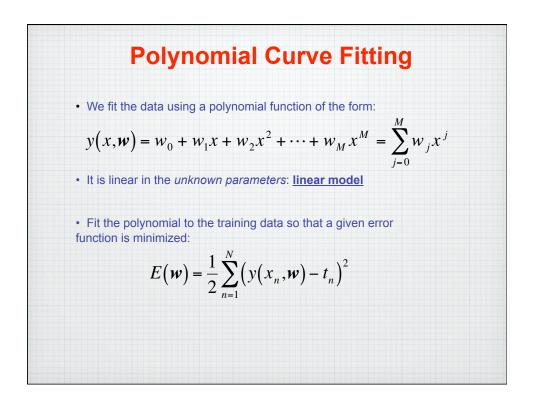

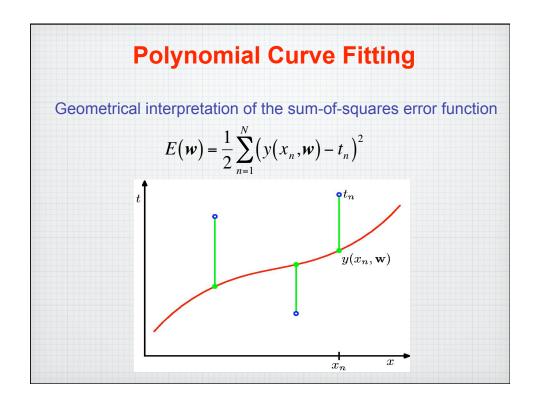

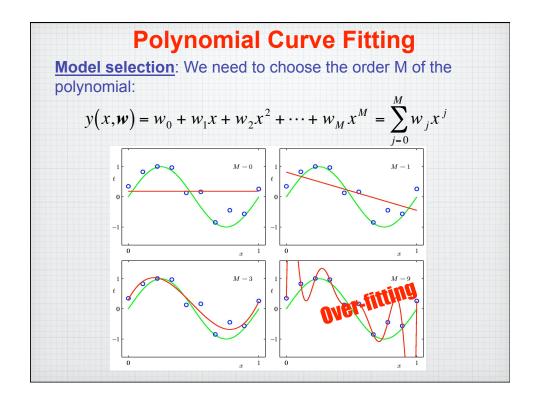

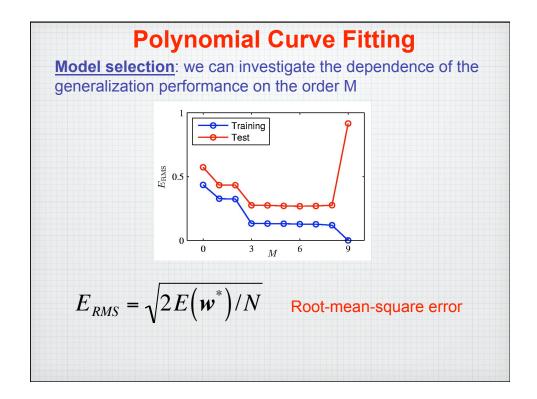

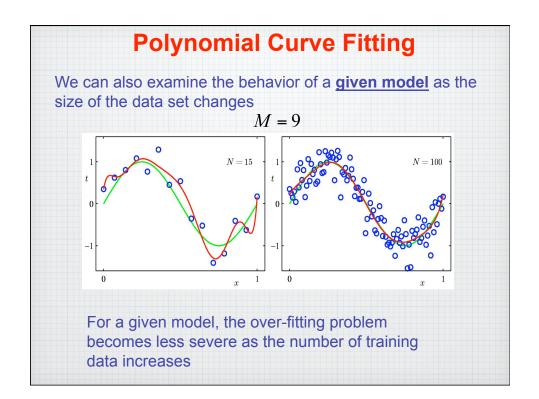

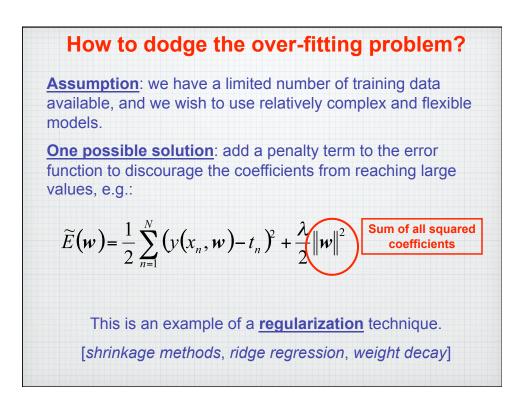

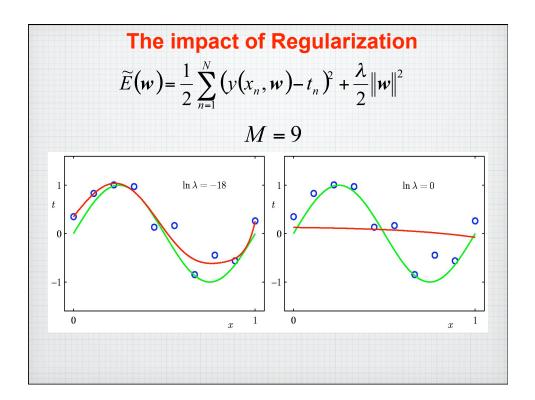

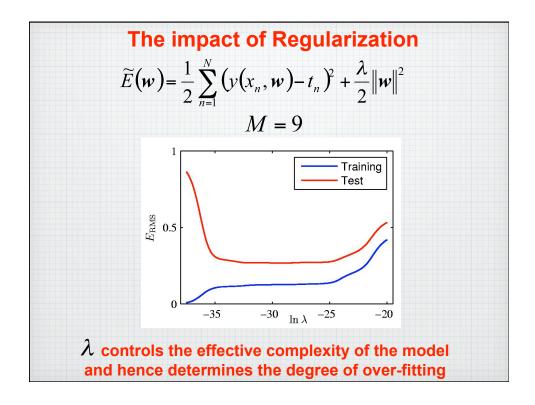

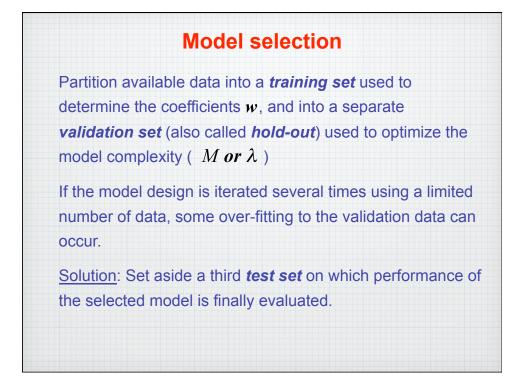

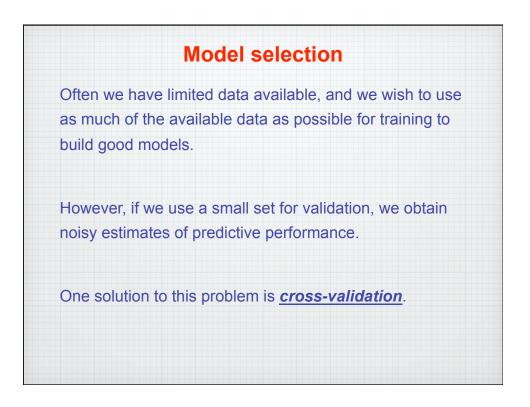

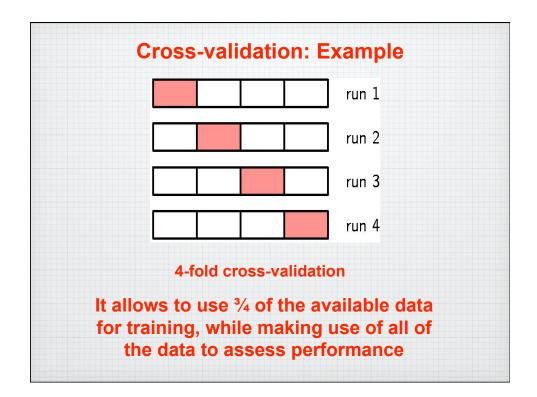

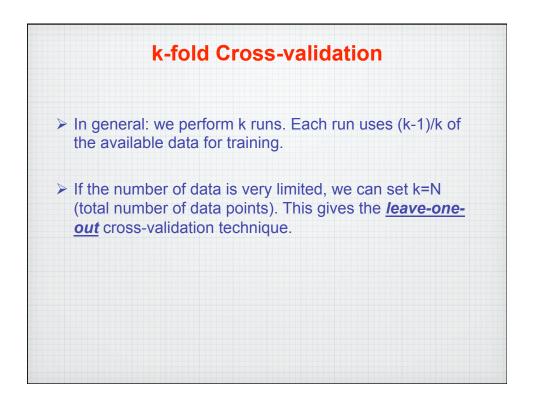

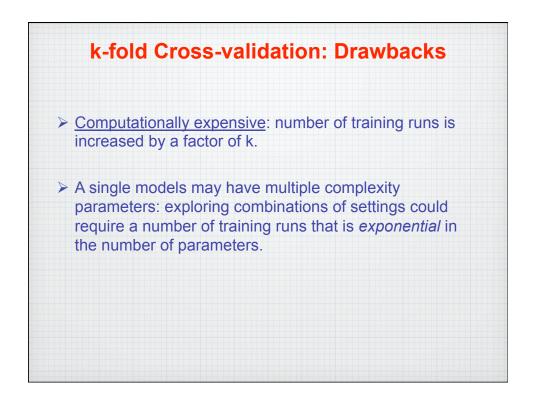

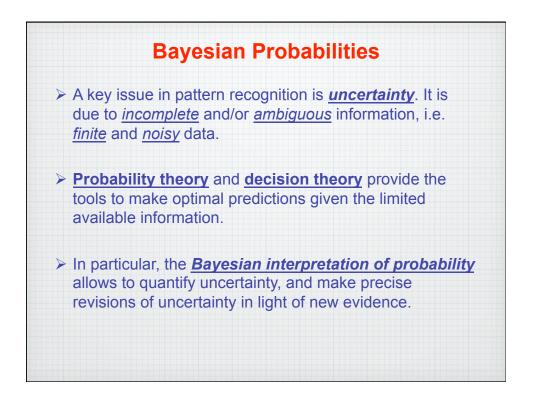

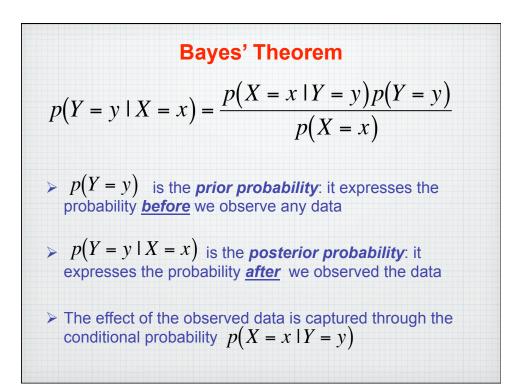

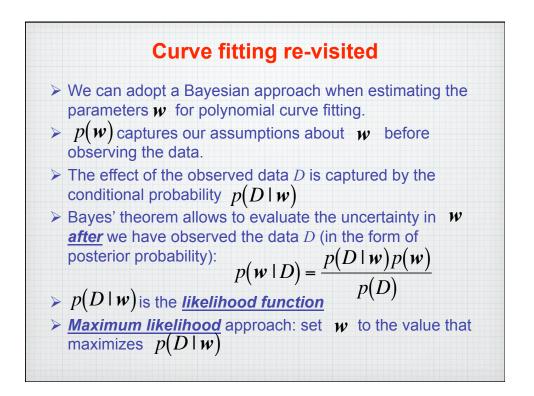

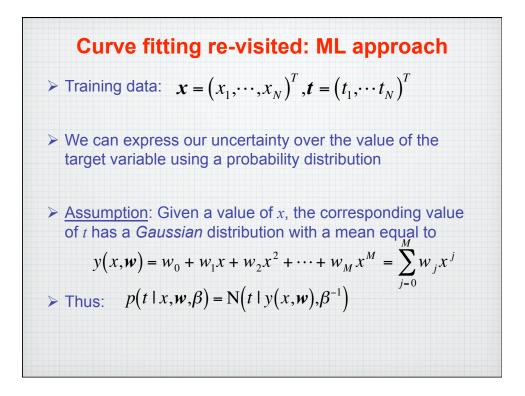

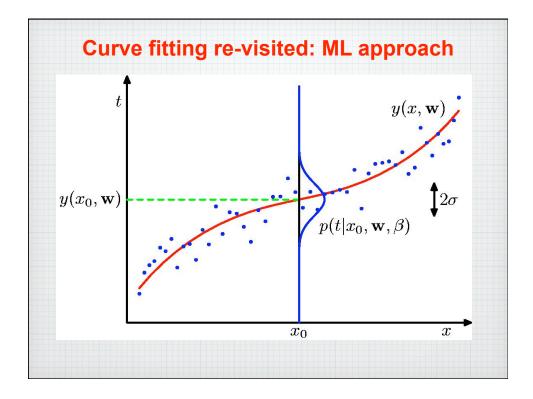

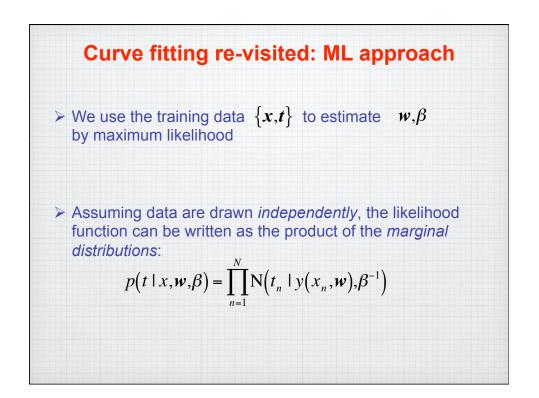

Curve fitting re-visited: ML approach
Solution:
$$N(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

 $\mu = y(x,w), \sigma^2 = \beta^{-1}$
 $\Rightarrow \ln p(t \mid x, w, \beta) = \ln \prod_{n=1}^N N(t_n \mid y(x_n, w), \beta^{-1})$
 $= \ln \prod_{n=1}^N \frac{1}{\sqrt{2\pi\beta^{-1}}} e^{-\frac{(t_n - y(x_n, w))^2}{2\beta^{-1}}}$
 $= -\frac{\beta}{2} \sum_{n=1}^N (t_n - y(x_n, w))^2 - \sum_{n=1}^N \ln \sqrt{2\pi\beta^{-1}}$
 $= -\frac{\beta}{2} \sum_{n=1}^N (t_n - y(x_n, w))^2 + \frac{N}{2} \ln \beta - \frac{N}{2} \ln(2\pi)$
